

Document 4: DSP Parameter Mapping & Compiler Behavior Specification

4.1 Decoupled Compile Architecture

The compilation sub-service derives processing parameters exclusively via the parameter descriptors registered by the active pedal definitions. Coordinate structures remain isolated from DSP core modifications.

4.2 Compilation Triggers & Lifecycle

Compilation follows a strict Pen-Up Execution Model via the state compiler. While the cursor or stylus is actively dragging across the canvas interface, compilation is blocked. The compiler pipeline initiates only upon canvas structural release following the messaging rules defined in Document 5.
